

### GENERAL DESCRIPTION

The SGM2210 is a low quiescent current, low noise and low dropout voltage linear regulator. It is capable of supplying 300mA output current with typical dropout voltage of 240mV. The operating input voltage range is from 2.5V to 20V. The fixed output voltage range is from 1.2V to 5.0V and adjustable output voltage range is from 1.2V to 12V.

Other features include logic-controlled shutdown mode, short-circuit current limit and thermal shutdown protection. The SGM2210 has automatic discharge function to quickly discharge  $V_{OUT}$  in the disabled status.

The SGM2210 is available in a Green SOT-23-5 package. It operates over an operating temperature range of -40°C to +125°C.

### FEATURES

- **Operating Input Voltage Range: 2.5V to 20V**
- **Fixed Outputs of 1.2V, 1.8V, 2.5V, 3.0V, 3.3V, 3.6V and 5.0V**
- **Adjustable Output from 1.2V to 12V**
- **300mA Output Current**
- **Output Voltage Accuracy:  $\pm 1\%$  at +25°C**
- **Quiescent Current: 36 $\mu$ A (TYP)**
- **Low Dropout: 80mV (TYP) at 100mA,  $V_{OUT} = 3.3V$**
- **Low Noise: 48 $\mu$ V<sub>RMS</sub> (TYP) at  $V_{OUT} = 3.3V$**
- **High PSRR: 100dB (TYP) at 1kHz**
- **Current Limiting and Thermal Protection**
- **With Output Automatic Discharge**
- **Stable with Small Case Size Ceramic Capacitors**
- **Reverse Current Protection when  $V_{OUT} > V_{IN}$**
- **Shutdown Supply Current: 0.5 $\mu$ A (TYP)**
- **-40°C to +125°C Operating Temperature Range**
- **Available in a Green SOT-23-5 Package**

## OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

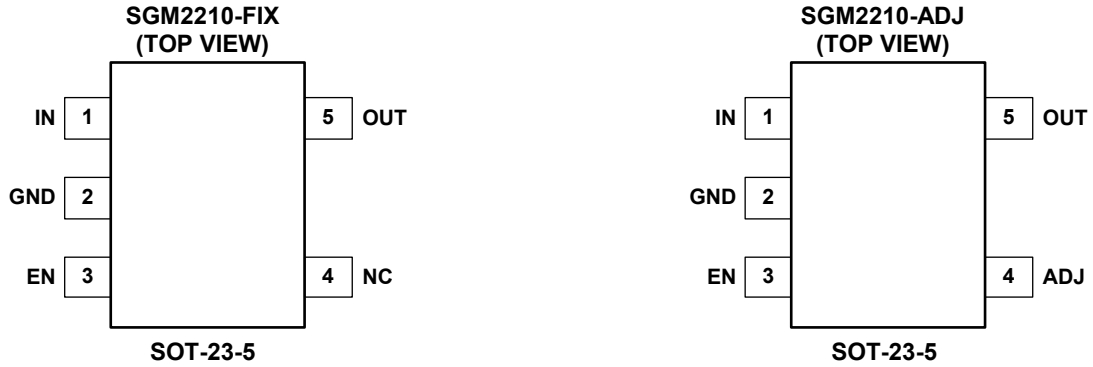

## ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

PIN CONFIGURATIONS

PIN DESCRIPTION

PIN	NAME	FUNCTION
1	IN	Input Supply Voltage Pin. It is recommended to use a 2.2µF or larger ceramic capacitor from IN pin to ground to get good power supply decoupling. This ceramic capacitor should be placed as close as possible to IN pin.
2	GND	Ground.
3	EN	Enable Pin. Drive EN high to turn on the regulator. Drive EN low to turn off the regulator.
4	NC	No Connection (fixed voltage version only).
	ADJ	Feedback Voltage Input Pin (adjustable voltage version only). Connect this pin to the midpoint of an external resistor divider to adjust the output voltage. Place the resistors as close as possible to this pin.
5	OUT	Regulator Output Pin. It is recommended to use a ceramic capacitor with effective capacitance in the range of 1.5µF to 22µF to ensure stability. This ceramic capacitor should be placed as close as possible to OUT pin.

## APPLICATION INFORMATION

The SGM2210 is a low quiescent current, low noise and low dropout voltage linear regulator and provides 300mA output current. These features make the device a reliable solution to solve many challenging problems in the generation of clean and accurate power supply. The high performance also makes the SGM2210 useful in a variety of applications. The SGM2210 provides protection functions for output overload, output short-circuit condition and overheating.

The SGM2210 provides an EN pin as an external chip enable control to enable/disable the device. When the regulator is in shutdown state, the shutdown current consumes as low as 0.5µA (TYP).

### Input Capacitor Selection ( $C_{IN}$ )

The input decoupling capacitor should be placed as close as possible to the IN pin to ensure the device stability. 2.2µF or larger X7R or X5R ceramic capacitor is selected to get good dynamic performance.

When  $V_{IN}$  is required to provide large current instantaneously, a large effective input capacitor is required. Multiple input capacitors can limit the input tracking inductance. Adding more input capacitors is available to restrict the ringing and to keep it below the device absolute maximum ratings.

### Output Capacitor Selection ( $C_{OUT}$ )

The output decoupling capacitor should be placed as close as possible to the OUT pin. 2.2µF or larger X7R or X5R ceramic capacitor is selected to get good dynamic performance. The minimum effective capacitance of  $C_{OUT}$  that SGM2210 can remain stable is 1.5µF. For ceramic capacitor, temperature, DC bias and package size will change the effective capacitance, so enough margin of  $C_{OUT}$  must be considered in design. Additionally,  $C_{OUT}$  with larger capacitance and lower ESR will help increase the high frequency PSRR and improve the load transient response.

### Adjustable Regulator

The output voltage of the SGM2210-ADJ can be adjusted from 1.2V to 12V. The ADJ pin will be connected to two external resistors as shown in Figure 4. The output voltage is determined by the following equation:

$$V_{OUT} = V_{ADJ} \times \left( 1 + \frac{R_1}{R_2} \right) \quad (1)$$

where:

$V_{OUT}$  is output voltage and  $V_{ADJ}$  is the internal voltage reference,  $V_{ADJ} = 1.2V$ .

One parallel capacitor ( $C_{FF}$ ) with  $R_1$  can be used to improve the feedback loop stability and PSRR, increase the transient response and reduce the output noise. Use  $R_2 = 150k\Omega$  to maintain an 8µA minimum load.

Figure 4. Adjustable Output Voltage Application

### Enable Operation

The EN pin of the SGM2210 is used to enable/disable the device and to deactivate/activate the output automatic discharge function.

When the EN pin voltage is lower than 0.4V, the device is in shutdown state. There is no current flowing from IN to OUT pins. In this state, the automatic discharge transistor is active to discharge the output voltage through a 95Ω (TYP) resistor.

When the EN pin voltage is higher than 1.3V, the device is in active state. The output voltage is regulated to the expected value and the automatic discharge transistor is turned off.

### Reverse Current Protection

The SGM2210 integrates reverse current protection between the OUT pin and the IN pin. When the monitoring circuit of the SGM2210 detects the output voltage is higher than the input voltage, it prevents the flowing of current from the OUT pin to the IN pin. In the case of  $V_{IN}$  is equal to 15V and  $V_{OUT}$  is equal to 20V, this feature reduces leakage current from the  $V_{OUT}$  to  $V_{IN}$  to 22µA (TYP). In addition, the reverse current protection circuit can work only when  $V_{OUT} - V_{IN} \leq 5V$ . If the voltage between the OUT pin and the IN pin exceeds 5V, the SGM2210 will be damaged.

**APPLICATION INFORMATION (continued)**

**Output Current Limit and Short-Circuit Protection**

When overload events happen, the output current is internally limited to 900mA (TYP). When the OUT pin is shorted to ground, the short-circuit protection will limit the output current to 600mA (TYP).

**Thermal Shutdown**

The SGM2210 can detect the temperature of die. When the die temperature exceeds the threshold value of thermal shutdown, the SGM2210 will be in shutdown

state and it will remain in this state until the die temperature decreases to +135°C.

**Layout Guidelines**

To get good PSRR, low output noise and high transient response performance, the input and output bypass capacitors must be placed as close as possible to the IN pin and OUT pin separately.  $V_{IN}$  and  $V_{OUT}$  had better use separate ground planes and these ground planes are single point connected to the GND pin.
