

### DESCRIPTION

The MP4658 is a 4-string, secondary-side LED driver for LED backlighting, and is ideal for monitor and small-sized TV LED backlighting. It controls the flyback power stage to regulate the LED current loop and the output supply voltage. The MP4658 integrates 4-string LED current balancing. Powered by a 6V to 36V input supply voltage ( $V_{IN}$ ), the MP4658 outputs a compensation signal to control the primary-side flyback (or other power stage) via an optocoupler to regulate the output voltage ( $V_{OUT}$ ).

The MP4658 supports analog dimming and PWM dimming to the LED current through the ADIM and PDIM pins. For analog dimming, apply a pulse signal with a frequency above 5kHz to the ADIM pin. For PWM dimming, apply a low-frequency PWM signal to the PDIM pin. The MP4658 also supports analog mode PWM dimming to the LED current, which makes the LED current rise and fall softly.

The MP4658 features numerous smart protections to increase system reliability, including open LED protection, short LED string protection, LEDx short-to-ground protection, FB over-voltage protection (OVP), feedback open protection, and thermal protection. The MP4658 is available in an SOIC-16 package.

### FEATURES

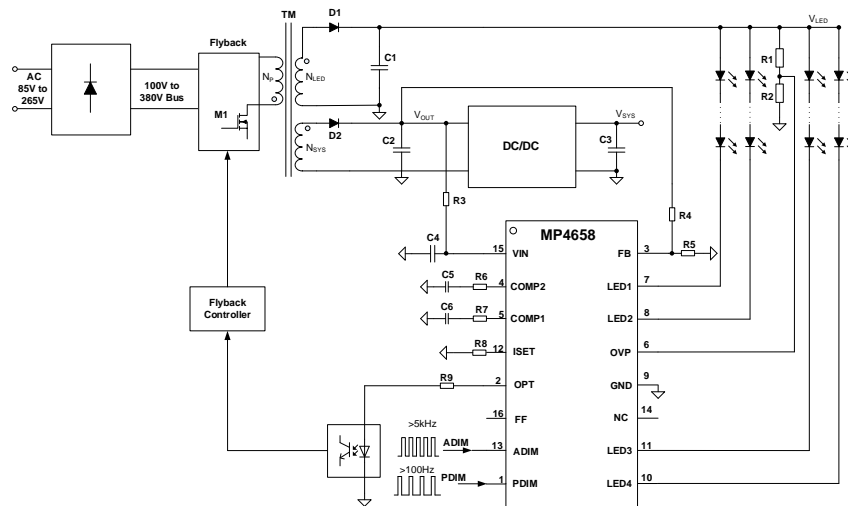

- 6V to 36V Supply Voltage ( $V_{IN}$ )
- 80V/200mA, 4-String LED Current Balance
- Provides Feedback for the Previous Power Stage
- <2% LED Current Accuracy
- 1.5% LED Current Balance
- Low LEDx Regulation Voltage, High Efficiency
- Analog and PWM Dimming
- LED Open Protection, LED Short Protection
- LEDx Pin Short-to-GND Protection
- Over-Voltage Protection (OVP)
- Thermal Protection
- Available in an SOIC-16 Package

### APPLICATIONS

- LCD Monitor and TVs
- Desktop LCD Flat Panel Displays
- Flat-Panel Video Displays

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

### PACKAGE REFERENCE

## PIN FUNCTIONS

Pin #	Name	Description
1	PDIM	<b>PWM dimming input pin.</b> Connect a pulse signal to implement pulse-width modulation (PWM) dimming. When the PDIM pin's voltage remains low for 30ms, the LED stage is disabled and the IC enters constant voltage (CV) mode.
2	OPT	<b>Optocoupler pin.</b> This pin outputs the compensation signal for the primary-side flyback power stage. Connect this pin to the external optocoupler to control the flyback.
3	FB	<b>System voltage feedback.</b> Connect this pin to the system output through a voltage divider.
4	COMP2	<b>Compensation pin.</b> This pin compensates the output voltage ( $V_{OUT}$ ) loop and controls the flyback power stage during the LED off period.
5	COMP1	<b>Compensation pin.</b> This pin compensates the LED current loop and controls the flyback power stage during the LED on period.
6	OVP	<b>Over-voltage protection (OVP) pin.</b> Connect this pin to the LED voltage ( $V_{LED}$ ) output through a voltage divider.
7	LED1	<b>Cathode of LED string 1.</b>
8	LED2	<b>Cathode of LED string 2.</b>
9	GND	<b>Ground.</b>
10	LED4	<b>Cathode of LED string 4.</b>
11	LED3	<b>Cathode of LED string 3.</b>
12	ISET	<b>LED current set pin.</b> This pin sets the LED current. Connect a resistor from this pin to the ground to set the LED current ( $I_{LED}$ ).
13	ADIM	<b>Analog dimming input pin.</b> Connect a >5kHz PWM signal to implement analog dimming. The input impedance of this pin determines the internal filter constant, as well as the PWM dimming rise and fall times. When the ADIM pin's voltage remains low for 30ms, the LED stage is disabled and the IC enters CV mode.
14	NC	<b>Not connected.</b>
15	VIN	<b>Input supply pin.</b> This pin powers all internal logic circuitry.
16	FF	<b>Fault indicator pin.</b> If a fault occurs, this pin is pulled low.

### ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

VIN .....	-0.3V to +38V
LEDx.....	-0.3V to +80V
FF .....	-0.3V to +12V
Other pins.....	-0.3V to +6.5V
Junction temperature .....	150°C
Lead temperature .....	260°C
Continuous power dissipation ( $T_A = 25^\circ\text{C}$ ) <sup>(2)</sup>	1.56W
Storage temperature .....	-60°C to +150°C

### ESD Ratings

Human body model (HBM) .....	±2000V
Charged device model (CDM).....	±750V

### Recommended Operating Conditions <sup>(3)</sup>

Supply voltage ( $V_{IN}$ ) .....	6V to 36V
Operating junction temp ( $T_J$ ) ....	-40°C to +125°C

<b>Thermal Resistance <sup>(4)</sup></b>	<b><math>\theta_{JA}</math></b>	<b><math>\theta_{JC}</math></b>
SOIC-16.....	80 .....	35... °C/W

#### Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J$  (MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D$  (MAX) =  $(T_J$  (MAX) -  $T_A$ ) /  $\theta_{JA}$ . Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- The device is not guaranteed to function outside of its operating conditions.
- Measured on JESD51-7, 4-layer PCB.

## ELECTRICAL CHARACTERISTICS

$V_{IN} = 12V$ ,  $T_A = 25^\circ C$ , unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Units
<b>VIN Supply</b>						
VIN supply range			6		36	V
VIN UVLO	$V_{IN\_UVLO}$		4.5	4.79	5.5	V
VIN UVLO hysteresis	$V_{IN\_HYS\_UVLO}$			500		mV
Quiescent current	$I_Q$	PWM = ADIM = 0			0.5	mA
<b>Analog Dimming</b>						
ADIM logic high	$V_{ADIM\_HI}$		1.5			V
ADIM logic low	$V_{ADIM\_LO}$				0.4	V
ADIM/PWM pull-down resistor	$R_{ADIM\_DOWN}$			1		MΩ
Analog dimming input frequency range			5 <sup>(5)</sup>		100 <sup>(5)</sup>	kHz
Duration to disable the ADIM pin	$t_{ADIM\_ST}$			30		ms
ADIM pin input impedance for slow soft PWM dimming (3ms)			25		50	kΩ

## OPERATION

The MP4658 is a 4-string, secondary-side LED driver for LED backlighting, and is ideal for monitor and TV LED backlighting. It controls the flyback power stage to regulate the LED current ( $I_{LED}$ ) loop during the PWM on time and regulate system supply voltage loop during the PWM off time. Powered by a 6V to 36V input voltage ( $V_{IN}$ ) supply, the MP4658 outputs a compensation signal to control the primary-side flyback (or other power stage) through an optocoupler.

### Start-Up

When the flyback is on,  $V_{IN}$  is charged until it reaches its UVLO threshold, at which point the system logic starts to work.

### LED Current and Voltage Regulation

The MP4658 accurately regulates the  $I_{LED}$  loop or the output voltage ( $V_{OUT}$ ) with a single flyback power stage.

When pulse-width modulation (PWM) dimming is on, the MP4658 regulates  $I_{LED}$  through the flyback power stage control (see Figure 2).

**Figure 2: MP4658 Control Scheme when PWM Dimming Is On**

When PWM dimming is off, the LED stage is disabled and the MP4658 regulates the output voltage ( $V_{OUT}$ ) using the feedback (FB) voltage ( $V_{FB}$ ) from the FB pin (see Figure 3).

**Figure 3: MP4658 Control Scheme when PWM Dimming Is Off**

### LED Current Regulation when PWM Dimming Is On

For the  $I_{LED}$  regulation loop, the minimum LEDx voltage ( $V_{LEDx}$ ) is fed back and compared to the internal reference voltage. This reference changes with the  $I_{LED}$  setting. The internal error amplifier (EA) regulates the average minimum

$V_{LEDx}$  to the internal reference voltage. The EA's output is connected to the external current-loop compensation network on the COMP1 pin through an inner switch (S1). During the PWM on time, S1 is on and the minimum  $V_{LEDx}$  is regulated by this control loop. The flyback power is set by the COMP1 voltage ( $V_{COMP1}$ ). During the PWM off period, S1 is turned off, the compensation network is disconnected from the EA's output, and  $V_{COMP1}$  remains steady until the next PWM on interval. The EA's output is also pulled low during the PWM off period.

### Output Voltage Regulation when PWM Dimming Is Off

When PWM dimming is off, the output voltage ( $V_{OUT}$ ) is fed back to the FB pin and the internal  $V_{REF}$  is equal to 1.2V. During the PWM off period, the MP4658 regulates  $V_{OUT}$  by controlling the flyback power stage. The internal voltage-loop EA regulates the average  $V_{FB}$  to its internal reference. The EA's output is connected to the external voltage-loop compensation network on the COMP2 pin. The flyback power is set by the COMP2 voltage ( $V_{COMP2}$ ).

When PWM dimming is on, the flyback power is controlled by  $V_{COMP1}$  and  $V_{OUT}$  varies with different dimming conditions. The voltage-loop EA's output is also pulled low.

### Dimming Control

The MP4658 provides analog dimming and PWM dimming for  $I_{LED}$  through the separate ADIM and PDIM pin. For analog dimming, apply a pulse signal with a frequency above 5kHz to the ADIM pin and pull the PDIM pin high. The pulse signal's duty cycle sets the  $I_{LED}$  amplitude. For PWM dimming, the duty cycle of input signal at the ADIM pin sets the peak  $I_{LED}$  value.  $I_{LED}$  is chopped by the input PWM signal at the PDIM pin. The brightness of the LED string is proportional to the external PWM signal's duty cycle, which helps achieve fast and high-contrast ratio PWM dimming. For analog PWM dimming, apply a <5kHz pulse signal to the ADIM pin and pull the PDIM pin high. The ADIM pin's input impedance determines the internal analog dimming RC filter and the rising/falling speed during PWM dimming. If the input

impedance on ADIM is below 15k $\Omega$ , then the RC filter constant is smaller and the  $I_{LED}$  rising/falling speed during PWM dimming is faster. Soft PWM dimming for  $I_{LED}$  helps reduce the audible noise.

### Protection Features

The MP4658 integrates sufficient protections for the output voltage stage and LED driver stage. The protections for the  $V_{OUT}$  stage includes system over-voltage protection (OVP) and open feedback loop protection. Fault protections for the LED driver stage include open LED protection, short LED string protection, one or more LED short protection and LEDx short to ground protection.

### Output Over-Voltage Protection (OVP)

The FB pin senses  $V_{OUT}$  for regulation and OVP. If  $V_{FB}$  is 24% greater than  $V_{REF}$ , the MP4658 triggers output OVP and the OPT pin is clamped to 3.3V when the LED stage is off. Output OVP is disabled when the LED stage is on. The fault indicator outputs a low voltage when output OVP is triggered.

### Feedback Open Protection

If  $V_{FB}$  is below 500mV, the IC latches off and the fault indicator outputs a low voltage.

### Open LED Protection

The LED string voltage is sensed by the OVP pin. Open LED protection is achieved via the OVP pin voltage and the LEDx (LED1~4) pin voltage detections. If one or more LED strings are open, the respective  $V_{LEDx}$  is pulled to ground and the LED string's output voltage keeps increasing until the OVP pin's voltage ( $V_{OVP}$ ) reaches the OVP threshold. When  $V_{OVP}$  reaches 2.4V and  $V_{LEDx}$  is below 100mV, the MP4658 triggers open LED protection. The IC marks off the open string(s), meaning any that have a  $V_{LEDx}$  below 100mV. The remaining LED strings discharge the output voltage and  $V_{OVP}$  decreases until it falls below the OVP threshold. Then the LED control loop recovers and the minimum  $V_{LEDx}$  of the remaining LED strings is regulated. If an LED open fault is triggered, the fault indicator pin outputs a low voltage.

If all LED strings are open, all strings are marked off and the LED control loop is disabled. If an open all LED strings condition occurs, the IC operation mode switches from constant current (CC) mode to constant voltage (CV) mode.

If  $V_{OVP}$  exceeds 3V, the IC latches off. This function protects the components from any out of control condition (such as the LED output voltage exceeding  $V_{OV\_LED}$  when the OPT pin is not pulled high) and keeps the system safe.

### LED Short Protection

$V_{LEDx}$  is used to indicate a short LED condition. If an LED string is shorted, the respective  $V_{LEDx}$  increases significantly. If  $V_{LEDx}$  exceeds 5V for 5ms, a short fault is triggered, and the MP4658 marks off this string. Other strings keep working if they are not experiencing a short.

If short protection is triggered, the fault indicator outputs a low voltage.

### LEDx Short-to-Ground Protection

If COMP1 is saturated and  $V_{LEDx}$  is low for 30ms, the IC triggers LEDx short-to-ground protection. The LED control loop is disabled, and the output voltage is regulated in constant voltage (CV) mode. If this protection is triggered, the fault indicator outputs a low voltage.

The LED loop can recover from a fault condition by toggling the ADIM or PDIM pin. Pull either pin low for more than 30ms, then pull it high. The fault condition should be removed, and the fault indicator should reset.

### Thermal Protection

Thermal protection is integrated in the MP4658. If the die temperature exceeds the over-temperature (OT) threshold (150°C), the IC stops working until the die temperature falls to 125°C.

## APPLICATION INFORMATION

### Open LED Protection (OVP)

The OVP pin monitors the LED output voltage and controls open LED protection. Connect this pin to the LED output voltage through a voltage divider, and set the OVP point using Equation (1):

$$V_{OV\_LED} = \frac{2.4V \times (R_{OVPH} + R_{OVPL})}{R_{OVPL}} \quad (1)$$

Where  $R_{OVPH}$  and  $R_{OVPL}$  are the high-side and low-side resistors of the voltage divider, respectively.

### Output Voltage Feedback (FB)

The FB pin feeds back the output voltage ( $V_{OUT}$ ). Connect this pin to the output voltage through a voltage divider. This voltage divider determines  $V_{OUT}$ , which can be calculated with Equation (2):

$$V_{OUT} = \frac{1.2V \times (R_{VFBH} + R_{VFBL})}{R_{VFBL}} \quad (2)$$

Where  $R_{VFBH}$  and  $R_{VFBL}$  are the high-side and low-side resistors of the voltage divider, respectively.

### LED Current Setting

The LED current ( $I_{LED}$ ) is set by the resistor on the ISET pin. The ISET pin outputs a 1.6V voltage and its sourcing current determines  $I_{LED}$ . Estimate  $I_{LED}$  with Equation (3):

$$I_{LED} (mA) = \frac{80k\Omega \times 200mA}{R_{ISET} (k\Omega)} \quad (3)$$

### Selecting the Turn Ratios of the Power Transformer

The power transformer includes three power windings: the primary-side winding, the LED secondary-side winding and the output voltage winding. Follow these steps to design the turn ratios of the power transformer:

Design the turn ratio between the primary-side winding and LED secondary-side winding using  $N_P:N_{LED}$ . The maximum voltage stress on the primary-side switch occurs at the maximum input AC voltage and maximum output LED voltage.

Calculate the maximum voltage stress on the primary-side switch ( $V_{DS\_PRI}$ ) with Equation (4):

$$V_{DS\_PRI} = 1.414 \times V_{IN\_AC\_MAX} + (V_{OV\_LED} + V_{DIODE}) \times \frac{N_P}{N_{LED}} \quad (4)$$

Considering the leakage inductance of the flyback transformer, assume a 60V spike voltage on the primary-side switch and a 10% derating of the switch voltage capability. Calculate the primary-side switch's rating voltage with Equation (5):

$$V_{DS\_PRI} + 60 \leq 0.9 \times V_{RATING\_PRI} \quad (5)$$

Calculate the turn ratio ( $N_P:N_{LED}$ ) between the primary-side winding ( $N_P$ ) and the secondary LED winding ( $N_{LED}$ ) with Equation (6):

$$N_P:N_{LED} = \frac{(0.9 \times V_{RATING\_PRI} - 60V - 1.414 \times V_{IN\_AC\_MAX})}{V_{OV\_LED} + V_{DIODE}} \quad (6)$$

Where  $V_{RATING\_PRI}$  is the rating voltage of the primary-side switch,  $V_{IN\_AC\_MAX}$  is the maximum input AC voltage,  $V_{DIODE}$  is the forward voltage of the rectifier diode, and  $V_{OV\_LED}$  is the OVP point of the LED output voltage.

Design the turn ratio between the LED winding and the output voltage winding:  $N_{LED}:N_{SYS}$ . When the LED stage is working, the LED winding voltage ( $V_{LED}$ ) clamps the system winding voltage via the turn ratio. Ensure that  $V_{OUT}$  exceeds the voltage set with Equation (2) when the LED stage is on with the minimum  $V_{LED}$ . Estimate this relationship with Equation (7):

$$V_{OUT} + V_{DIODE} \leq \frac{V_{LED\_MIN} + V_{DIODE}}{\frac{N_{LED}}{N_{SYS}}} \quad (7)$$

Where  $V_{LED\_MIN}$  is the minimum LED output voltage. Choose a 10% margin for production design, calculated with Equation (8):

$$N_{LED}:N_{SYS} \leq \frac{0.9 \times (V_{LED\_MIN} + V_{DIODE})}{V_{OUT} + V_{DIODE}} \quad (8)$$

### PCB Layout Guidelines

Efficient PCB layout is important to achieve reliable operation, good EMI performance and excellent thermal performance. For the best results, refer to Figure 4 and follow the guidelines below:

1. Minimize the area of the power stage loop. This includes the primary loop (input capacitor, transformer, and MOSFET sense resistor), as well as the secondary-side winding loop (transformer, rectifier, and output capacitor).
2. Separate the output loop GND and control circuit GND, and only connect them at the GND pin.
3. Place the peripheral electronic components (such as those for VIN, FB, COMP1, and COMP2) as close to the IC as possible to decouple noise.

**Figure 4: Recommended PCB Layout**
