

## Low Dropout Voltage Regulator with Reset

### ■ GENERAL DISCRIPTION

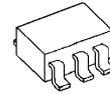

The NJU7272 is a low drop out voltage regulator with input-monitor reset function with delay.

Advanced CMOS technology achieves ultra low current consumption and high accuracy.

It delivers up to 5V/100mA output power with the maximum input voltage of 9V.

The NJU7272 suitable for MPU applications.

### ■ PACKAGE OUTLINE

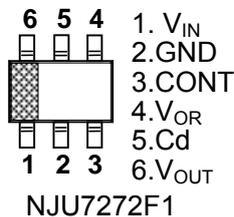

NJU7272F1

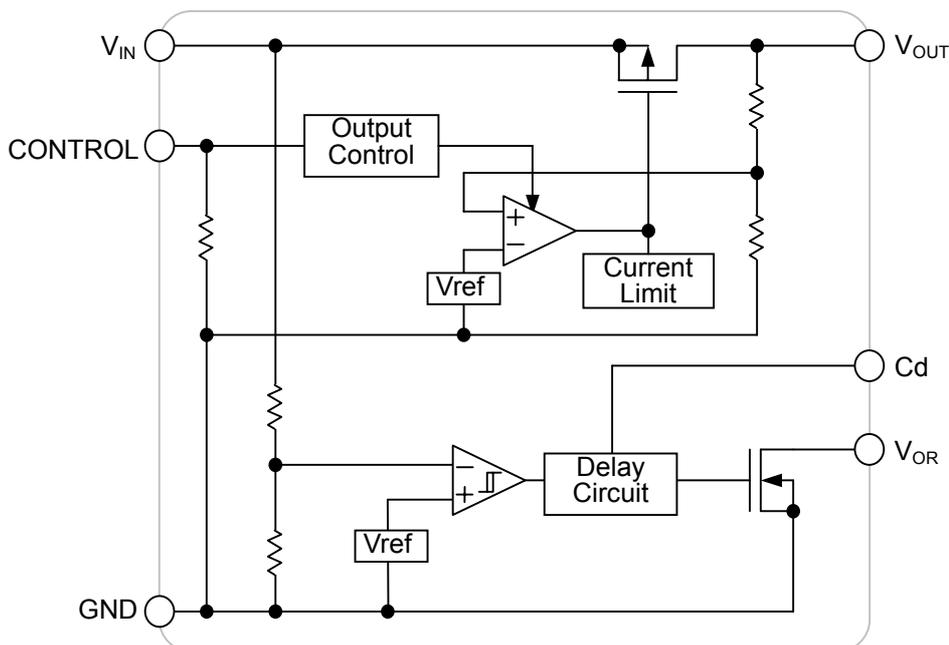

### ■ FEATURES

- Ultra Low Quiescent Current  $I_q = 3.5\mu\text{A typ. } (I_o = 0\text{mA})$
- Output Voltage Accuracy  $V_o = \pm 1.0\%$
- Reset Voltage Accuracy  $V_{RT} = \pm 1.0\%$
- Input Voltage Monitor type
- Adjustable delay time with external capacitor
- Output Current  $I_o(\text{max.}) = 100\text{mA}$
- Output capacitor with 0.1 $\mu\text{F}$  ceramic capacitor
- Nch Open Drain Output
- Internal Short Circuit Current Limit
- CMOS Technology
- Package Outline SOT-23-6

## ■ TYPICAL APPLICATION

① In case that ON/OFF Control is not required:

Connect control terminal to  $V_{IN}$  terminal.

② In use of ON/OFF Control:

State of control terminal:

- "H" → output is enabled.
- "L" or "open" → output is disabled.

**\*Input Capacitance  $C_{IN}$**

Input Capacitance  $C_{IN}$  is required to prevent oscillation and reduce power supply ripple for applications with high power supply impedance or a long power supply line.

Use the  $C_{IN}$  value of 0.1  $\mu\text{F}$  greater to avoid the problem.

$C_{IN}$  should connect between GND and  $V_{IN}$  as short as possible.

**\*Output Capacitance  $C_o$**

Output capacitor ( $C_o$ ) is required for a phase compensation of the internal error amplifier. The capacitance and the equivalent series resistance (ESR) influence stability of the regulator.

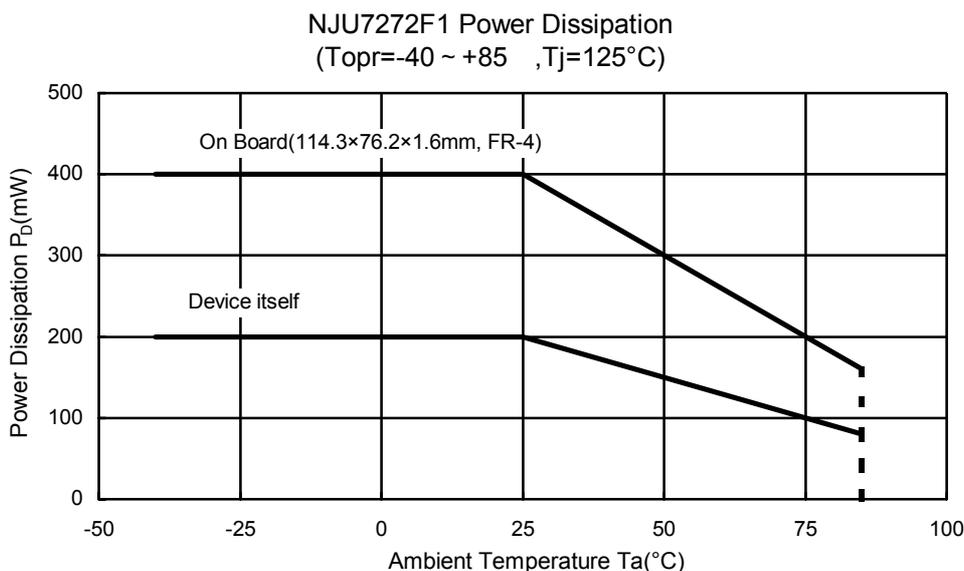

If use a smaller  $C_o$ , it may cause excess output noise or oscillation of the regulator due to lack of the phase compensation. Therefore, use  $C_o$  with the recommended capacitance or greater value and connect between  $V_o$  terminal and GND terminal with minimal wiring.

The recommended capacitance depends on the output voltage. Low voltage regulator requires greater value of the  $C_o$ . Thus, check the recommended capacitance for each output voltage.

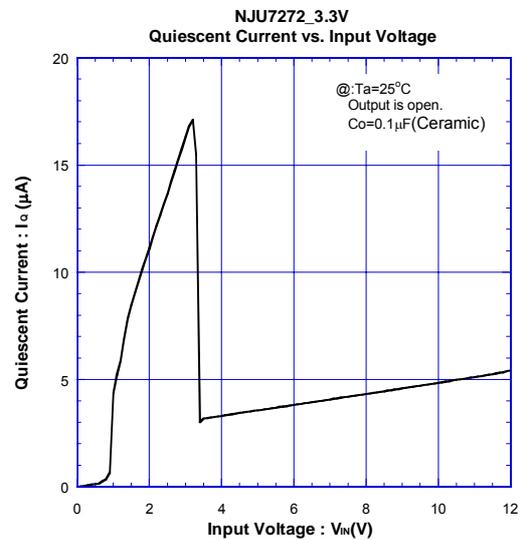

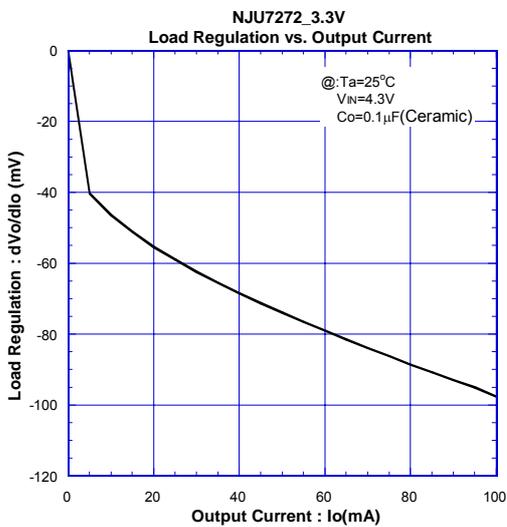

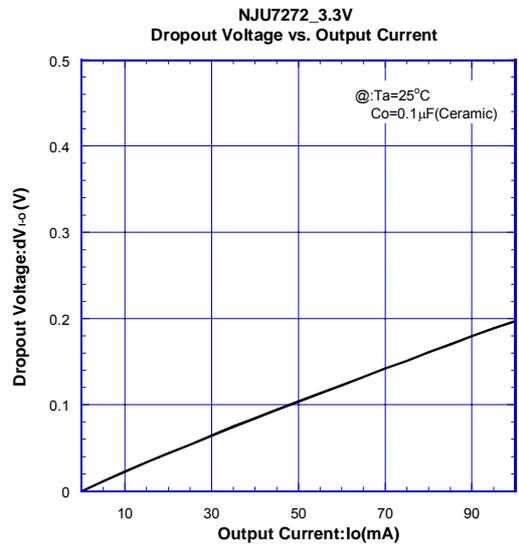

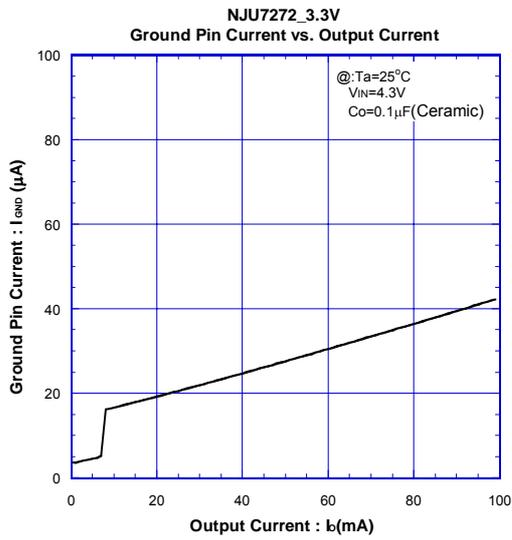

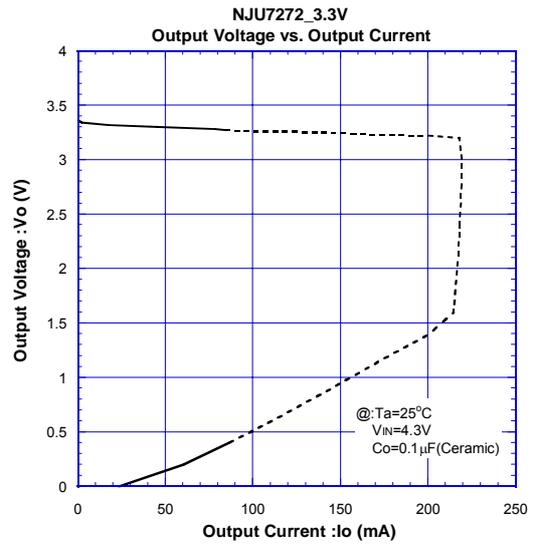

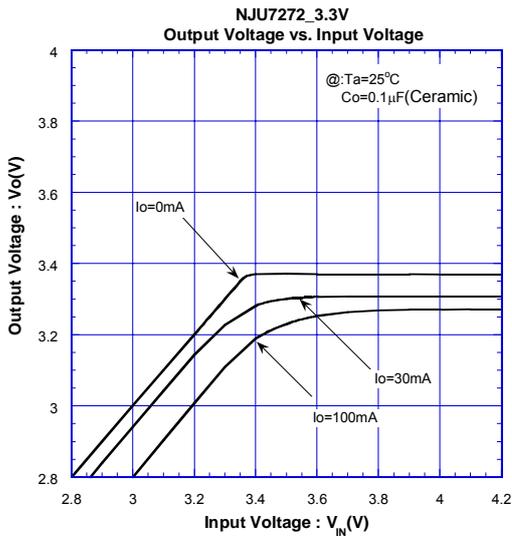

Use of a greater  $C_o$  reduces output noise and ripple output, and also improves transient response of the output voltage against rapid load change.

This product is designed to work with any capacitor including a low ESR capacitor for the  $C_o$ ; however, refer "Equivalent Series Resistance vs. Output Current" and choose suitable capacitor.
